

Lofthus - Frukt og saft

Introduction

Project management for a company called Lofthus - Frukt og saft. I red the course assignment several times before I started at all. Started doing some research to find out which people to hire to create a website. Read about why one should employ a front-end developer and a back-end developer, and maybe not just a full-stack developer. The reason was that you get usually better skills if you hire some one which is specialized in a specific language.

Body

I used my lessons to manage to find out how I should set up the whole project. How to make a gantt chart and write a report. Started to plan which people I needed for my project to get everything done. Found out who to hire, and started to make a list of different task for the different people with different skills and speciality.

Project manager which is me, needed:

Front-end developer - Code in html, css and Java-script.

Back-end developer - Take care of server and database. PHP, SQL

Web-designer (ux/ui) - User experience and interaction design.

Copywriter - Market researchers and text-formatter

Photographer - Taking photo's of staff and place.

After the task's was listed I started to make the Gantt-chart in Excel inside Google docs. I used google's spreadsheet so everybody on the team could be invited to look at the gantt-chart and used google drive for sharing other files that was necessary to get the team work together on the same files. This was a smart solution because everybody on the team got a google account and everybody was familiar with how the google drive worked.

The copywriter did research on the start of the project to check the market and see how many other sites there are who sells the same products that *Lofthus - Frukt og saft* do. He did also did a analyze based on the competition in the market to see how we can make a better site and make the costumer happy.

Summary and evaluation

I found it a little hard to know which people to hire and what they should do, and I also found it difficult to know how deep down my granularity should be, but I manage to figure it out after a while.

References

I used all the references which was listed on the CA on noroff.

Lynda.com - Videos of project management and making a gantt-chart

Lynda.com - Videos of how to use google drive.

Google - To read about different titles, like copywriter, frond-end developer, back-end developer.

Googled also different web-project to see which people you need to hire and what they should do.
